Fix an image that links to itself in WordPress

Article Number: 1149 | Rating: Unrated | Last Updated: Mon, Nov 16, 2020 at 10:18 PM

When configured incorrectly, WordPress can make your images on your page or post link to the image itself. This can cause a poor user experience if the user clicks on the image and leaves the page or if a search engine ends up linking to the image instead of your post. You can use these steps to fix this issue. Click on **Pages** or **Posts** depending which you need to edit. Click the **edit** under the page or post title. Click on the image in the text box. Click the **Edit** button to edit the image. Click the drop-down menu for **Link To** and select **None**. Click the **Update** button to save your changes to the image. Click the **Update** button to publish your changes to the page or post. Review your page or post to verify that the duplicate featured image has been removed.
