You can control your Managed WordPress account through [WP-CLI](#) (WordPress Command Line Interface). If you're proficient with command line interfaces, this can be a much simpler way to get around WordPress. Access your Managed WordPress account via SSH ([more info](#)). Change to your account's `html` directory using the following command:

```
cd html
```

Run the WP-CLI application using the following command:

```
wp
```

You can find a full list of commands on the WP-CLI site [here](#). We have also created a custom command `wp purge` which clears your Managed WordPress account's cache. **Example Commands** To update all plugins, run the following command:

```
wp plugin update --all
```

To update all themes, run the following command:

```
wp theme update --all
```

To repair your database, run the following command:

```
wp db repair
```
