Change PHP settings for my hosting account

Article Number: 1224 | Rating: 1/5 from 2 votes | Last Updated: Wed, Nov 18, 2020 at 9:50 PM

If the default PHP settings for your hosting account don't meet the requirements of your website or application, follow these steps to change your PHP settings. Read ourÂ article about the filename for PHP initialization filesÂ and determine what this filename is for your hosting account. For example, if you have Windows Hosting with Plesk, this filename is .user.ini. Look for that filename in theÂ *root directory*Â of your account. That's the file you need to edit in the next step. If youÂ *can't find*Â that file in the root directory, use a text editor to create the file and then save it in the root directory. Be sure youÂ name the file as specified in our article. Edit the file **Example:**

```
memory_limit = 128M
max_input_vars = 2000
upload_max_filesize = 64M
post_max_size = 64M
max_execution_time = 120
```

Note:Â For specific info on these PHP settings, seeÂ the PHP documentation for core php.ini directives. Take the necessary stepsÂ for the changes to take effect. Use a phpinfo fileÂ to confirm the changes are complete.
