

## Plesk: Renew a certificate

Article Number: 1405 | Rating: 1/5 from 1 votes | Last Updated: Wed, Dec 2, 2020 at 6:17 PM

After we approve your certificate renewal request, you can download your SSL and intermediate certificate. You must install both files on your Web server. Follow the instructions below to install your renewed SSL certificate and the certificate bundle on your Web server. **Installing Renewed SSL Certificate and Certificate Bundle** Before you install your issued SSL certificate you must install our certificate bundle (sf\_bundle.crt) on your Web server. (You may also download the certificate bundle from the [repository](#). The bundle is located in the **Root Bundle** section.) Log in to Parallels Plesk Panel. From the left-hand menu, select **Domains**. Click on the domain name that the certificate is issued for. Click on the **Certificates** menu item. Click the **Browse** and locate your signed SSL certificate. Select the certificate file; then click **Send File**. Navigate to the location of the saved site certificate you received from us. Select it, then select **Send File** - this will upload and install the certificate against the corresponding private key. On the displayed list, click on the name of the certificate. Open the certificate bundle (sf\_bundle.crt) in a text editor and copy and paste its contents into the box labeled **CA Certificate**. Click the **Send Text** button. Click **Up Level**; then choose **Setup**. At the top of the page, change the **SSL Certificate** drop-down menu to the certificate you have just installed. Click the **Server** item from the left-hand menu. Click on the **Service Management** menu item. Stop and Start the Apache process. **Note:** Simply restarting Apache will not work. You must stop the service; then start it again to complete the installation.
