Manually install an SSL certificate on my Microsoft Azure Web App

Article Number: 1484 | Rating: Unrated | Last Updated: Wed, Dec 2, 2020 at 7:56 PM

After your certificate request is approved, you can download your certificate from the SSL manager and install it on your Microsoft IIS Server. Once the certificate is installed on your IIS server, follow this guide to convert the certificate to aÂ `.pfx`Â file and upload it to your Microsoft Azure Portal. If you are utilizing an Azure Virtual Machine instead of an Azure Web App, you will want toÂ connect to your instanceÂ and install the certificate manually. Click on yourÂ **Start Menu**, then clickÂ **Run**. In the prompt, typeÂ **inetmgr**Â and clickÂ **OK**Â to launch the Internet Information Services (IIS) Manager. Under theÂ **Connections**Â panel on the left, click on yourÂ **Server Name**. In the main panel under theÂ **IIS**Â section, double click onÂ **Server Certificates**. Select your recently installed certificate. Under theÂ **Actions**Â panel on the right, clickÂ **Export...**. In the new window, clickÂ **...**Â under theÂ **Export to:**Â section. Find the directory on your server where certificate and key files are stored, then type out your desiredÂ **File name**. ClickÂ **Open**. For theÂ **Password**Â andÂ **Confirm password**Â fields, type in a password to secure the file. This will be used when uploading the file to Azure. ClickÂ **OK**Â to create theÂ `.pfx`Â file. Sign in to your Azure portal atÂ https://portal.azure.com. On the left sidebar, clickÂ **App Services**Â and select your app in the new listing column that appears. On the left sidebar within your application area, find theÂ **SETTINGS**Â grouping and clickÂ **SSL certificates**. In the newÂ **SSL**Â area, clickÂ **Upload Certificate**. On theÂ **Add certificate**Â sidebar to the right, click theÂ **folder icon**Â to browse and select yourÂ `.pfx`Â file and clickÂ **Open**. Type out your password for theÂ `.pfx`Â file in theÂ **Certificate password**Â field and clickÂ **Submit**. In the mainÂ **SSL**Â area, clickÂ **Add binding**Â below your new certificate. On theÂ **Add SSL Binding**Â sidebar to the right, select yourÂ **Hostname**Â andÂ **Certificate**. ChooseÂ *SNI SSL*Â forÂ **SSL Type**Â and clickÂ **Add Binding**Â to finalize the SSL install. **Note:**Â As a courtesy, we provide information about how to use certain third-party products, but we do not endorse or directly support third-party products and we are not responsible for the functions or reliability of such products.
