When you get an 0x800-type error in Outlook or Outlook Express, you can check the error in the Microsoft Support Database (<http://support.microsoft.com>), which will give you the cause and the solution to the error. Some of the common causes include: **SMTP authentication enabled or disabled when it should be the opposite** Try switching between the two if either works. **Your ISP blocking access to third-party SMTP servers** Try changing the SMTP port to 587 or using your ISP's server details. **Your Outlook account becoming corrupt** Try deleting and recreating the account. **The hosting package domain name have only been created in the last few hours** Wait for the DNS changes to fully propagate. **Your firewall blocking your mail client** If you have not used this client before, see if it is having a problem with your firewall settings.
