

How do I edit php.ini settings?

Article Number: 421 | Rating: 1/5 from 1 votes | Last Updated: Thu, Apr 23, 2015 at 12:19 PM

There are some variables that can be overwritten in the php.ini file, but we cannot offer any support should it not produce the desired results for your scripts. To overwrite the variables: Create a php.ini file in your text editor In the php.ini, type in the following command:

```
variable_name = variable_value
```

Where the name is the variable you want to change and the value is the value you want to put into place Save your php.ini file and upload it to the directory you want to use You can find a complete set of php.ini directives: <http://php.net/manual/en/ini.list.php> However, you should only overwrite the variables that are needed for your application.Â Other settings may cause your scripts to malfunction or make them vulnerable to attack.
