

How do I access the shared secure server available for my account?

Article Number: 439 | Rating: 1.5/5 from 4 votes | Last Updated: Tue, Jan 12, 2021 at 2:53 PM

If your account comes with access to our secure web server, you can use it to accept data securely on your website, which is convenient for e-commerce or other data you need to keep protected. To use it, link to the following URL whenever you need to securely load a page: `https://[server-name].secure-secure.co.uk/[your-domain]/` Where [server-name] is the server your account is on, and [your-domain] is your domain name. You can find which server you are on by going to your eXtend Control Panel and looking at 'Web Server' under 'Account Info' in the right-hand column. So, for example, if your domain name is `www.thisismydomain.com` and you are on server web5, your secure server access would be: `https://web5.secure-secure.co.uk/thisismydomain.com/` And if you wanted your `login.html` page to be a secure page, you would link to:

`https://web5.secure-secure.co.uk/thisismydomain.com/login.html` Please remember to use `https://` when linking to the secure server. If you are a Reseller, you will also need to enable Secure Server Access for the domain and/or hosting package. This can be done while creating or editing a hosting package, under 'E-Commerce'. It will take up to one hour for the server to become active after you enable it.
