If you want to stop people from downloading a file, you have two options: **Upload the file to the root** Upload the file outside your public_html folder. People will not be able to download the file, but you can call it by the absolute path it is located at. To upload your file to root: Log into your site through FTP or the File Manager Go to the directory that 'public_html' sits in Upload your files there To access your file: In any other file that needs to access that file, use the absolute server path: /home/sites/[DOMAIN]/[FILE] Where [DOMAIN] is your domain name (such as your-domain.co.uk) and [FILE] is the file name and extension (such as database.txt). Create a Password-Protected Directory Create a password-protected directory within your public_html folder. You can set up a password-directory folder in your eXtend Control Panel. To set up a password-protected directory: Log into your eXtend Control Panel Click 'Password Protection' under 'Web Tools' Enter in the directory you want to protect Enter in a username Enter in a password Click 'Add Protection' The directory will now be protected
