

Set up my Linux Hosting account

Article Number: 870 | Rating: Unrated | Last Updated: Wed, Jun 3, 2020 at 10:33 PM

After you purchase a Linux Hosting plan, you need to set it up before you can use it to host your website.

Linux accounts automatically configure the domain's zone file to use its information, including the primary A record and MX records. If the customer is using our nameservers, and the domain is in the same account as the hosting, setting up Linux Hosting will bring down the customer's website and email. Go to your Heart InternetÂ [customer area](#) Â and select **cPanel Hosting** . Select the your desired cPanel hosting account and select **Login** . Enter the domain you wish to use and select **Next**. Choose the data center you wish for your website to be hosted in.

Tip: For websites hosted in the UK, you should select *Amsterdam* . You will be allowed to set up a WordPress site to work with at this stage, you can select **Yes** or **No** . Account provisioning will take a few minutes, but once complete you're all set.
