

End PHP processes in my Linux Hosting account

Article Number: 891 | Rating: Unrated | Last Updated: Wed, Jun 3, 2020 at 11:04 PM

You may need to end PHP processes in your Linux Hosting account - for example, to manage runaway scripts or get a PHP initialization file to take effect. **Note:** Ending a process kills all current connections to the process. Any users connected to the process will have to reconnect. Go to your Heart Internet [customer area](#) and select **cPanel Hosting**. Select the your desired cPanel hosting account and select **Login**. In the account **Dashboard**, click **cPanel Admin**. In the cPanel Home page, in the **Software** section, click **Select PHP Version**. Below **PHP Selector | Extensions**, next to **PHP version**, click the current version, choose a *different* version from the list, and then click **Set as current**. For example, if your current version is 7.2, select 7.1. Repeat the previous step, but choose the version you were using before and don't forget to click **Set as current**.
