

Patching Your Server

Article Number: 936 | Rating: Unrated | Last Updated: Wed, Sep 9, 2020 at 8:15 PM

To protect yourself from security vulnerabilities, you must patch your server regularly. Developing a monthly or weekly habit of performing this simple task can save you a lot of grief and hassle later on. The process to patch your server depends on what operating system your server uses: **Fedora or Cent OS** Connect to your server via SSH Switch to the root user Run the following:

yum clean all

yum update **Ubuntu** Connect to your server via SSH (more info). Switch to the root user (more info). Run the following:

apt-get upgrade **Windows Server** Connect to your server via RDC ([more info](#)). From the "Start" menu, select "Control Panel". Click "Windows Update". Click "Check for Updates", and then complete the steps to update your server.
