Find My PHP Version Using Phpinfo

Article Number: 974 | Rating: Unrated | Last Updated: Wed, Sep 2, 2020 at 7:52 PM

One way to find your account PHP settings is to upload a PHP info script. This works on any account that supports PHP. Create a new text file containing the following line:

<?php phpinfo(); ?> Save this file asâ€info.php. Upload it to the public space of any website. After you upload it, go toâ€http://your domain name/info.php Viewing this page will show you what version of PHP you are running, as well as all of the installed PHP modules and their settings.
