

## Find My PHP Version Using Phpinfo

Article Number: 974 | Rating: Unrated | Last Updated: Thu, Jun 25, 2026 at 12:10 PM

One way to find your account PHP settings is to upload a PHP info script. This works on any account that supports PHP. Create a new text file containing the following line:

`<?php phpinfo(); ?>` Save this file as **info.php**. Upload it to the public space of any website. After you upload it, go to **<http://your domain name/info.php>** Viewing this page will show you what version of PHP you are running, as well as all of the installed PHP modules and their settings. **Note** - Once you have obtained the required information, we recommend removing the phpinfo.php file, as it exposes details of your PHP environment that should not be left publicly accessible.
